3.9 STM32G4xx_System_Private_Functions

Functions

- void SystemInit (void)

  Setup the microcontroller system.
- void SystemCoreClockUpdate (void)

  Update SystemCoreClock variable according to Clock Register Values. The SystemCoreClock variable contains the core clock (HCLK), it can be used by the user application to setup the SysTick timer or configure other parameters.

3.9.1 Detailed Description

3.9.2 Function Documentation

3.9.2.1 SystemCoreClockUpdate()

```
void SystemCoreClockUpdate (
            void  )
```

Update SystemCoreClock variable according to Clock Register Values. The SystemCoreClock variable contains the core clock (HCLK), it can be used by the user application to setup the SysTick timer or configure other parameters.

Note

Each time the core clock (HCLK) changes, this function must be called to update SystemCoreClock variable value. Otherwise, any configuration based on this variable will be incorrect.

- The system frequency computed by this function is not the real frequency in the chip. It is calculated based on the predefined constant and the selected clock source:

- If SYSCLK source is HSI, SystemCoreClock will contain the HSI_VALUE(**)
- If SYSCLK source is HSE, SystemCoreClock will contain the HSE_VALUE(***)
- If SYSCLK source is PLL, SystemCoreClock will contain the HSE_VALUE(***) or HSI_VALUE(*) multiplied/divided by the PLL factors.

(**) HSI_VALUE is a constant defined in stm32g4xx_hal.h file (default value 16 MHz) but the real value may vary depending on the variations in voltage and temperature.

(***) HSE_VALUE is a constant defined in stm32g4xx_hal.h file (default value 24 MHz), user has to ensure that HSE_VALUE is same as the real frequency of the crystal used. Otherwise, this function may have wrong result.

- The result of this function could be not correct when using fractional value for HSE crystal.

#include "stm32g4xx_it.h"
```

Functions

- void **NMI_Handler** (void)

  This function handles Non maskable interrupt.
- void **HardFault_Handler** (void)

  This function handles Hard fault interrupt.
- void **MemManage_Handler** (void)

  This function handles Memory management fault.
- void **BusFault_Handler** (void)

  This function handles Prefetch fault, memory access fault.
- void **UsageFault_Handler** (void)

  This function handles Undefined instruction or illegal state.
- void **SVC_Handler** (void)

  This function handles System service call via SWI instruction.
- void **DebugMon_Handler** (void)

  This function handles Debug monitor.
- void **PendSV_Handler** (void)

  This function handles Pendable request for system service.
- void **SysTick_Handler** (void)

  This function handles System tick timer.
- void **DMA1_Channel1_IRQHandler** (void)

  This function handles DMA1 channel1 global interrupt.
- void **TIM1_UP_TIM16_IRQHandler** (void)

  This function handles TIM1 update interrupt and TIM16 global interrupt.
- void **USART2_IRQHandler** (void)

  This function handles USART2 global interrupt / USART2 wake-up interrupt through EXTI line 26.
- void **EXTI15_10_IRQHandler** (void)

  This function handles EXTI line[15:10] interrupts.

4.9.1 Detailed Description

STM32CubeIDE System Memory calls file.

Author

Generated by STM32CubeIDE

```
For more information about which C functions

please consult the newlib libc manual
```

Attention

4.9.2 Function Documentation

4.9.2.1 _sbrk()

```
void * _sbrk (
            ptrdiff_t incr )
```

_sbrk() allocates memory to the newlib heap and is used by malloc and others from the C library

```
* ##########################################################################
* #  .data  #  .bss  #       newlib heap       #          MSP stack          #
* #         #        #                         # Reserved by _Min_Stack_Size #
* ##########################################################################
* ^-- RAM start      ^-- _end                             _estack, RAM end --^
*
```

This implementation starts allocating at the '_end' linker symbol The '_Min_Stack_Size' linker symbol reserves a memory for the MSP stack The implementation considers '_estack' linker symbol to be RAM end NOTE: If the MSP stack, at any point during execution, grows larger than the reserved size, please increase the '_Min_Stack_Size'.

Parameters

incr	Memory size

Macros

- #define HSE_VALUE 24000000U
- #define HSI_VALUE 16000000U

Functions

- void SystemInit (void)

  Setup the microcontroller system.
- void SystemCoreClockUpdate (void)

  Update SystemCoreClock variable according to Clock Register Values. The SystemCoreClock variable contains the core clock (HCLK), it can be used by the user application to setup the SysTick timer or configure other parameters.

Variables

- uint32_t **SystemCoreClock** = HSI_VALUE

4.10.1 Detailed Description

CMSIS Cortex-M4 Device Peripheral Access Layer System Source File.

Author

MCD Application Team

This file provides two functions and one global variable to be called from user application:

- SystemInit(): This function is called at startup just after reset and before branch to main program. This call is made inside the "startup_stm32g4xx.s" file.
- SystemCoreClock variable: Contains the core clock (HCLK), it can be used by the user application to setup the SysTick timer or configure other parameters.
- SystemCoreClockUpdate(): Updates the variable SystemCoreClock and must be called whenever the core clock is changed during program execution.

After each device reset the HSI (16 MHz) is used as system clock source. Then SystemInit() function is called, in "startup_stm32g4xx.s" file, to configure the system clock before to branch to main program.

4.10.2 This file configures the system clock as follows:

4.10.2.1 System Clock source | HSI

4.10.2.2 SYSCLK(Hz) | 16000000

4.10.2.3 HCLK(Hz) | 16000000

4.10.2.4 AHB Prescaler | 1

4.10.2.5 APB1 Prescaler | 1

4.10.2.6 APB2 Prescaler | 1

4.10.2.7 PLL_M | 1

4.10.2.8 PLL_N | 16

4.10.2.9 PLL_P | 7

4.10.2.10 PLL_Q | 2

4.10.2.11 PLL_R | 2

4.10.2.12 Require 48MHz for RNG | Disabled
